

## ROOSTER SAILING INFORMATION SHEET 2rset up Setting up your Carbon Tiller:

The tiller needs to be knocked into the stock by using the weight of the rudder on a soft surface (carpet) so that the end of the tiller can be seen at the end of the stock.

Now it will be hard to get out – so be prepared with a hammer and something to protect the carbon to knock it out at the end of the day – sometimes it can be worked out by wobbling.

It is important to ensure that the tiller is inserted until the end is level with the edge of the stock as shown in the picture.

The tie down can be accomplished with a simple 2:1 over the tiller to reduce any wear on the boat.

Notice the knot is a simple overhand knot that is easy to undo on the way ashore!
